

One up again for calculational programming  
 (an addition to our files)

In this note we deal with the following little programming exercise. Given integer arrays  $x, y [0..N]$ ,  $i \leq N$ , construct a program to compute the value of

$$\langle \forall i, j : 0 \leq i < N \wedge 0 \leq j < N \wedge i \neq j : x.i \leq y.j \rangle .$$

It was Jayadev Misra who conveyed the problem — through the medium of a table napkin — to Edsger W. Dijkstra, who solved it and, in turn, communicated the problem to me — by fax —.

We would very much like to invite the reader to try to solve the problem for himself, preferably without pencil and paper to start with.

\* \* \*

When I started to think about a solution without the use of pencil and paper, some sort of chaos tended to prevail. Then, with the use of these devices, I quickly solved the problem by employing one of our standard calculational techniques. I informed Dijkstra that I did it, be it that I had broken the symmetry between  $x$  and  $y$ . He replied that his solution was symmetric.

And because sometimes I have other things to do, I left the problem alone but put it on the agenda of the next ETAC.

\* \* \*

The ETAC, too, started to consider the problem without use of the whiteboard. How does one express gently, that the resulting discussion was not too convincing? Then I explained my calculational solution, while at the same time regretting the asymmetry.

After a while, Lex Bijlsma reminded us that in this kind of problem, where there are no monotonicities in  $x$  or  $y$ , it often pays to replace all occurrences of one and the same constant by one and the same variable. Following this proposal, we replaced both occurrences of  $N$  in our target expression by variable  $n$  and investigated an increase of  $n$  by 1:

$$\begin{aligned}
 & \langle \forall i, j : 0 \leq i < n+1 \wedge 0 \leq j < n+1 \wedge i \neq j : x.i \leq y.j \rangle \\
 &= \{ \text{split off } i=n \} \\
 & \langle \forall i, j : 0 \leq i < n \wedge 0 \leq j < n+1 \wedge i \neq j : x.i \leq y.j \rangle \\
 & \quad \wedge \\
 & \quad \langle \forall j : 0 \leq j < n+1 \wedge n \neq j : x.n \leq y.j \rangle \\
 &= \{ \text{split off } j=n \text{ in the first conjunct} \\
 & \quad \text{and simplify the second one} \}
 \end{aligned}$$

F Indeed, this has been a hint to our students far more than once

$$\begin{aligned}
 & \langle \forall i, j : 0 \leq i < n \wedge 0 \leq j < n \wedge i \neq j : x.i \leq y.j \rangle \\
 & \quad \wedge \\
 & \quad \langle \forall i : 0 \leq i < n \wedge i \neq n : x.i \leq y.n \rangle \\
 & \quad \wedge \\
 & \quad \langle \forall j : 0 \leq j < n : x.n \leq y.j \rangle \\
 \equiv & \quad \{ \text{using loop invariant } P_1 - \text{below-} \\
 & \quad \text{for the first conjunct, and} \\
 & \quad \text{loop invariant } P_0 - \text{below-, in} \\
 & \quad \text{particular } i \neq n, \text{ for the two} \\
 & \quad \text{other conjuncts} \} \\
 t \wedge & \quad \langle \uparrow i : 0 \leq i < n : x.i \rangle \leq y.n \\
 & \quad \wedge \quad x.n \leq \langle \downarrow j : 0 \leq j < n : y.j \rangle .
 \end{aligned}$$

The main invariants for our repetition are

$$P_0: \quad 1 \leq n \leq N \quad \text{and}$$

$$P_1: \quad t \equiv \langle \forall i, j : 0 \leq i < n \wedge 0 \leq j < n \wedge i \neq j : x.i \leq y.j \rangle,$$

and the above calculation shows that it is beneficial to strengthen them with

$$P_2: \quad f = \langle \uparrow i : 0 \leq i < n : x.i \rangle \quad \text{and}$$

$$P_3: \quad g = \langle \downarrow j : 0 \leq j < n : y.j \rangle .$$

The rest of the development is absolutely standard (and not that fascinating).

The program reads

$\{1 \leq N\}$

$n, t, f, g := 1, \text{true}, x.0, y.0$

;  $\{\text{inv } P_0..3\} \{ \forall f \ N = n \}$

do  $n \neq N \wedge t$

$\rightarrow t, f, g := (t \wedge) f \leq y.n \wedge x.n \leq g$   
 $\quad \quad \quad , f \uparrow x.n$   
 $\quad \quad \quad , g \downarrow y.n$

;  $n := n + 1$

od

\* \* \*

Thanks to the ETAC, to Lex in particular,  
and thanks to Edsger for challenging us.  
and, of course, to Jayadev for giving us  
this beautiful little problem.

W.H.J. Feijen,
